

Release Information GW5

Version: V1030

Release Date: 2026-10-15

New Features

- **Logout via USB-C**
Added support for logging out from the user interface when connected via USB-C.
- **Login via MQTT**
Added support for logging in via MQTT in the same manner as when using USB-C or the dongle.
- **New FTP Format 401**
Added support for **FTP Format 401**. Refer to the GW5 manual for configuration details and format specifications.
- **Extension Card Version**
The extension card firmware version can now be viewed in the Configurator.
- **Ethernet and DNS Configuration**
Previously, the configured DNS settings were overwritten when DHCP was enabled. It is now possible to choose whether the DNS settings should be obtained via DHCP or retained.

Bug Fixes

- **Extension Card – Excessive M-Bus Current Consumption**
The M-Bus extension card consumed approximately 30 μ A more current than expected. This has been corrected.
- **Possible Radio Hang**
Under certain conditions, an issue in the radio circuitry could cause invalid data to be received, potentially causing the radio to stop operating correctly. A recovery mechanism has been added, with automatic recovery within 6 minutes.
- **Possible SIM Failure on Battery-Powered Units**
Following a power loss, the gateway could repeatedly attempt to reconnect to the mobile network. The number of reconnection attempts is now limited to prevent a possible SIM failure.
- **Incorrect L-Value in Status Messages Sent via FTP/HTTP**
The gateway serial number has been changed back from 12 digits to 8 digits, and the L-value has been corrected.
